

# 1 Fundamental Theorem of Calculus II

If a function  $f$  is continuous on the open interval  $I$  containing  $a$ , then for every  $x$  in the interval

$$\frac{d}{dx} \int_a^b [f(t)dt] = f(x) \quad (1)$$

## 2 Proof

Begin by defining  $F$  as

$$F(x) = \int_a^x f(t)dt \quad (2)$$

Then, you can write by the definition of the derivative

$$\begin{aligned} F'(x) &= \lim_{\Delta x \rightarrow 0} \frac{F(x + \Delta x) - F(x)}{\Delta x} \\ &= \lim_{\Delta x \rightarrow 0} \frac{1}{\Delta x} \left[ \int_a^{x+\Delta x} f(t)dt - \int_a^x f(t)dt \right] \\ &= \lim_{\Delta x \rightarrow 0} \frac{1}{\Delta x} \left[ \int_a^{x+\Delta x} f(t)dt + \int_x^a f(t)dt \right] \\ &= \lim_{\Delta x \rightarrow 0} \frac{1}{\Delta x} \left[ \int_x^{x+\Delta x} f(t)dt \right] \end{aligned}$$

From the Mean Value Theorem for Integrals when  $\Delta x > 0$ , there exists a number  $c$  in the interval  $[x, x + \Delta x]$  such that the integral in the expression above is equal to  $f(c)\Delta x$ . Because  $x \leq c \leq x + \Delta x$ , it follows that  $c \rightarrow x$  as  $\Delta x \rightarrow 0$ .

$$F'(x) = \lim_{\Delta x \rightarrow 0} \left[ \frac{1}{\Delta x} f(c)\Delta x \right] = \lim_{\Delta x \rightarrow 0} f(c) = f(x)$$

Using the area model for definite integrals, the approximation

$$f(x)\Delta x \approx \int_x^{x+\Delta x} f(t)dt \quad (3)$$

can be viewed as the area of the height of  $f(x)$  and the width  $\Delta x$  is approximately equal to the area of the region between  $[x, x + \Delta x]$ .
